Why Choose Us?

At Real Smile Dentistry, our experienced doctors employ Fotona's state-of-the-art laser technology to ensure comfort and achieve optimal results. We're committed to enhancing complete health through dentistry and sleep quality.

Non-Invasive | No Pain

No Downtime | In-office Treatment

Dental lasers are playing an increasingly important role in periodontology, providing fast, simple and highly effective treatments for several procedures. Fotona's dual-wavelength Er:YAG and Nd:YAG dental lasers are the perfect tools for performing the widest variety of laser-assisted periodontal procedures in a minimally invasive, cost-effective manner.

Periodontal Laser Therapy

Periodontal disease, also known as **gum disease,** is a general term for a number of conditions that involve inflammation of the tissues that support and surround the teeth. The word "**periodontal**" means "**around the tooth**".

Periodontal Laser Therapy laser treatment is a non-invasive, alternative to traditional gum surgery that can help with a variety of dental conditions, including:

Gum Disease:
Periodontal Laser Therapy can effectively treat gum disease conditions such as gingivitis, periodontitis, and peri-implantitis by targeting and eliminating the infected tissue and harmful bacteria that contribute to these conditions. Additionally, the laser promotes bone regeneration and healing, helping to restore oral health and prevent further progression of the disease.

Bleeding Gums:
Periodontal Laser Therapy can address bleeding gums by targeting and removing the bacteria and diseased tissue that cause inflammation and bleeding in the gums, thereby promoting healing and reducing bleeding.

Receding Gums:
Periodontal Laser Therapy helps with receding gums by stimulating tissue regeneration and collagen production, which can help restore gum tissue and support the attachment of gums to teeth, reducing the progression of gum recession.

Bad Breath:
Periodontal Laser Therapy can help alleviate bad breath by removing the bacterial infection and debris associated with gum disease, which are often the underlying causes of chronic bad breath.

How it Works

- A small fiber optic light emits a specific wavelength of laser energy
- The laser targets infected tissue and bacteria in the gum pockets
- The laser stimulates blood to clot around the teeth, which helps gums reattach
- The laser creates a seal between the gums and teeth, similar to a clot

Benefits

- Less invasive than traditional gum surgery
- Quicker recovery time
- Less recession and sensitivity to cold
- Creates a sterile environment for tissue and bone to grow back together
- Reduces trauma to the surrounding area and minimizes bleeding

Scheduling Time

Each patient's oral cavity is distinct. Depending on where the periodontal issues lie and some patients having less teeth than others, will be the biggest factors in scheduling. The Doctor taking care of your treatment will let you know how much time is needed for the procedure and if this will take one or two visits to complete.

After completing these treatments, routine maintenance will be handled by your dental hygienist during regular dental cleanings.

Please set up an appointment for your consultation for this deep cleaning procedure.

With, **Periodontal Laser Therapy,** your dentist is able to create an environment where your body can regenerate itself. Your gums will reattach to the tooth; in fact, it is proven that PerioLase is the only laser to have a 100% success rate in tissue reconstruction.
