Real Smile Dentistry—A Clear Path to Breathing and Quality of Sleep that will Save your Life.

Offering both the NightLase® and NaseLase® alternative treatments using the professional Fotona device at Real Smile Dentistry. Dr. Nassery and Dr. Rezakhani are here to provide these distinctive treatments for you.

NIGHTLASE®

NightLase® Therapy

Easy, Non-Invasive & Pain-Free, the NightLase device uses gentle laser energy- warming, tightening and lifting of the tissue inside the mouth and at the back of the throat (soft palate). This patented technology is unique to Fotona, stimulating collagen with no damage to the skin or tissue in a safe and effective way. The treatment is typically done in three 20-minute sessions over a period of 6 weeks. Results are usually observed almost immediately, significantly improving airflow and reducing snoring. This quality of sleep provides a complete health upgrade.

How it Works

Using the laser to target the mucosa tissue in the oral cavity and the throat. This contracts the collagen and causes a tightening effect. Thus opening the airway, which is fundamental in alleviating snoring and mild sleep apnea.

Convenient & Effective:

The whole process is completed in three 20-minute sessions over 6 weeks, with lasting results. Patients usually feel only a warm sensation or mild pinching during the process. Patients can go about their day/night immediately post-treatment with no down-time. They can talk, eat, or drink right after the procedure is completed.

Proven Results:

There is a notable high success rate in greatly reducing snoring and maintaining quality of deep sleep. Patients can relax and rest more freely without additional sleep devices.

NASELASE®

NaseLase® Therapy

Advanced Nasal Therapy NaseLase strengthens and supports nostrils using focused gentle laser energy stimulating collagen production producing a tightening effect. This treatment is perfect for those with either small/collapsed nostrils, or enlarged turbinates in the nasal airway. Turbinates are bony structures located in the nasal passages that help to humidify and filter air. When they become swollen and enlarged, this is considered turbinate hypertrophy, a condition where the tissue in the nose swells and makes it difficult to breathe. NaseLase treatment can reduce the size of the turbinates and clear the air pathway. This works by using laser energy to "lift" and firm up the soft tissues in the nose, improving airflow.

How it Works

NaseLase reduces nasal resistance by targeting and firming inside the nasal passages through collagen production in the mucosa with a tightening effect. This eases any symptoms, eliminates turbinate hypertrophy while expanding the nostrils for better airflow without any invasive surgery.

Comfortable & Easy:

Three pain-free procedures of 5-10 minute sessions every 21 days. No downtime; patients can talk, eat, or drink right after the procedure is completed.

Proven Results:

Maintains clear nasal pathways and alleviates potential breathing difficulties with turbinate removal. Greater Airflow!

***Both the NightLase® and NaseLase® procedures can either be scheduled separately or paired together for combined comprehensive relief from obstructed airflow, pauses in breathing and lack of quality sleep.**
